Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: Cytokine that binds to TNPRSF13B/TACI and TNFRSF17/BCMA. TNFSF13/APRIL binds to the same 2 receptors. Together, they form a 2 ligands -2 receptors pathway involved in the stimulation of B-and T-cell function and the regulation of humoral immunity. A third B-cell specific BAFF-receptor (BAFFR/BR3) promotes the survival of mature B-cells and the B-cell response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "BAFF, a novel ligand of the tumor necrosis factor family, stimulates B cell growth.";

SIMILARITY: Belongs to the tumor necrosis factor family.
INFRSF17/BCMA. May be implicated in the regulation of tu growth. May be involved in monocyte/macrophage-mediated immunological processes. SUBUNI: Homotrimer (Potential). SUBCELLULAR LOCATION: Secreted. ALTERNATIVE PRODUCTS:

-!- FUNCTION: ATP-DEPENDENT DNA HELICASE REQUIRED FOR INITIATION OF
VIRAL DNA REPLICATION. IT FORMS A COMPLEX WITH THE VIRAL E2
PROTEIN. THE E1-E2 COMPLEX BINDS TO THE REPLICATION ORIGIN WHICH
CONTAINS BINDING SITES FOR BOTH PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ATP (POTENTIAL).

"Clothing and sequence analysis of cytokine CDNAs of llama and camel.";

"Conting and sequence analysis of cytokine cDNAs of llama and camel.";

"TWRSF1B/TWFR. It is mainly secreted by macrophages and can induce cell death of certain tumor.cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin I secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation (By similarity).

--- SUBBUIT: Homotorimer (By similarity).

--- SUBBUITS CATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Exp. Med. 178:49-62(1993).
-!- FUNCTION: GOLGI AUTO-ANTIGEN; MAY HAVE A FUNCTION IN THE PROCESSING AND TRANSPORT OF PROTEINS THROUGH THE GOLGI.
-!- DOMAIN: EXTENDED ROD-LIKE PROTEIN WITH COLLED-COIL DOMAINS.
-!- SIMILARITY: HIGH, TO RAT CIS-GOLGI MATRIX PROTEIN GM130.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -----IQNLEEGDELQLAIPRENAQISLDGDVTFFGALKL

   PKC ALSO SERVES AS
                                                                                                                   SIMILARITY: Contains 1 C2 domain.
SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
PKC SUBFAMILY.
PHOSPHORYLATES A RANGE OF CELLULAR PROTEINS. FKC ALSO SERVES THE RECEPTOR FOR PROMOTERS, A CLASS OF TUMOR PROMOTERS. SIMILARITY: Contains 2 zinc-dependent phorbol-ester and DAG binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7.3%; Score 81.5; DB 1; Length 737; 20.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                        polypeptide sequence. Tis polypeptides and antibodies are useful for identifying compounds which agonise and antibodies are useful for identifying compounds which agonise and antagonise Tis, and these can be enhance Tis activity (antagonist) and these can be enhance Tis activity (antagonist) can also be used to enhance Tis activity. Diseases or susceptibility to a disease can be diagnosed by determining the presence or absence of a mutation in the Tis protein. Tis polymucleotides are useful for locating genes associated with disease by hybridisation to chromosomes. Tis polypeptides and polymucleotides can be used, especially to raise an immune response (i.e. as vaccines) for the treatment of chronic and acute inflammation, arthritis, septicemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection.

C graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis, and Alzheimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181 KENKILVKETGYPFIYGQVLYTDKTYAMGHLIQRKKVHVFGDELSLVTLFRCIQNMPETL 240

The present sequence is a human T cell surface antigen, designated 53954. The novel protein designated 63954 is expressed on T cells.

Protein 63954 can modulate antigen-specific proliferation and cytokine production on effector cells and may potentiate immune cell expansion or apoptosis. 63954 agonists or antagonists may also act as a co-stimulatory molecule for regulation of T cell mediated cell activation, and may cause a shift of T helper cell types, e.g. between Thi-and Th2. Antagonists of 63954 can be used to modulate immune responses in abnormal situations, e.g. autoimmune disorders, including rheumatoid arthritis, systemic lupus erythematosis (SLB), Hashimoto's autoimmune thyroiditis, as well as acute and chronic inflammatory responses in which T cell activation, expansion, and/or immunological T cell memory play an important role, such as chronic inflammation or tissue rejection. The products can also be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The products can also be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 LTVVSFYQVAALQGDLASLRAELQGHHAEKLPAGRAPKAGLEEAPAVTAGLKIFEPPAP 120

Neutrokine alpha (NA) polypeptides modulate cell proliferation,

C differentiation, magration, cytotoxicity and cell death.

C differentiation, magration, cytotoxicity and cell death.

They can be used to treat e.g. tumour and itumour metastasis, infections

by bacteria, viruses and other parasites, immunodeficiencies,

c inflammatory diseases, lymphadenopathy, autoimmune diseases, graft

versus host diseases and to stimulate peripheral tolerance, destroy some

transformed cell lines, mediate cell activation and proliferation, and

are functionally linked as primary mediators of immune regulation and

c transformed cell lines, mediate cell activation and proliferation, and correction, myeloprotection, stem cell activation and immune enhancement

or suppression, myeloprotection, stem cell activation and theating and pulmonary fibrosis. They

correction inflammatory control and treatment of leukaemia. They can also

c including liver cirrhosis, osteoarthritis and pulmonary fibrosis. They

can also be used to regulate haematopoietic progenitor cells, e.g. to

can also be used to regulate haematopoietic progenitor cells, e.g. to

can differentiation of various haematopoietic progenitor cells, e.g. to

creasormation, activation of the HIV virus, garaft-hoots rejection, cerebral

creasorption, rheumatoid arthritis and cachexia (wasting or malnutrition).

They can also be used to treat e.g. autoimmune diseases such as multiple

creasorption, rheumatoid arthritis and cachexia (wasting or malnutrition).

They can also be used to treat e.g. autoimmune diseases such as multiple

creasorption, rheumatoid arthritis and sacrolossis, idiopathic pulmonary

fibrosis, idiopathic hyper-eosinophilic syndrome, endotoxic shock,

creasorption and release of histamine-mediated allergic reactions and immunication and endormany and each and each and each offerantial and harding and each offerantial and each offerantial and each offerantial and each offerance influence and infine and such as allergic asthma, rhinitis and eczema, inflammatory pulmonary diseases, rheumatoid arthritis, inflammation, degenerative and inflammatory arthropathies, aplastic ansemia, wyslodysplastic syndrome, subepithelial basement membrane fibrosis or adult respiratory distress syndrome. The products can also be used for detection, diagnosis and neutrokine alpha; cell proliferation; differentiation; migration; cytocoxicity;cell death; treatment; tumour; infection; inflammation; wound healing; immunodeficiency; autoimmune disease; graft rejection; fibrotic disorder; haematopoiesis; sepsis; shock; malaria; HIV; AIDS; acquired immune deficiency syndrome; rheumatoid arthritis; silicosis; cachexia; detection; diagnosis; drug screening. ```
regulatory roles in cell proliferation and/or differentiation, e.g. they can induce production of cytokines, immunoglobulins, etc. A variety of diseases can be treated by modulating the activity of TNFL proteins, c.g. they can induce apoptosis of activated T cells but rescue resting c.g. they can induce apoptosis of activated T cells but rescue resting T cell from apoptosis. TNFL polypeptides can therefore be used to treat autoimmune diseases, such as myssthania gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, multiple sclerosis, and systemic clupus erythematosus. TNFL proteins also have tumour stimulating properties, so tumours can be treated by inhibiting the expression or activity of TNFL other proliferative disorders, such as neoplasias, dysplasias, and hyperplasia can also be treated using TNFL inhibitors. The TNFL polypeptides and polynucleotides can also be used to enhance or decrease TNF activity, thus providing therapeutic benefits such as induction of cell death, lymphoid organogenesis, or host bacterial cresistance, and inhibition of endocoxic shock, contact hypersensitivity, and its receptors play a major role in host defence and immunosurveillance. As such, there is a need to identify new members of TNFR families. This invention provides this need.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

                                                                                                                                                   The present sequence represents human Kay-ligand, which is a member of the tumour necrosis factor (TNF) family of cytokines. Pharmaceutical compositions containing the Kay-ligand can be used to suppress or stimulate the immune system, especially to prevent or reduce the severity of autoimmune diseases or response to a tissue graft or to treat cancer. An agent capable of interfering with the Kay-ligand can be used to induce cell death. The Kay-ligand can also be used to identify
                                                                                                                                                                                                                                                                                                                                                                                          44

This invention describes isolated Tumor Necrosis Factor (TNF) family receptor polypeptides: APO4, APO6 and APO9 or their active fragments, and isolated TNF related ligands 1 and 3 (TNRL1 and TNRL3) or thair active fragments. APO4 is useful for diagnosing prostate cancer thair active fragments. APO4 is useful for diagnosing prostate cancer by determining levels of APO4 in an individual Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic moiety. APO4 polypeptides are also useful for identifying selective binding agents to the polypeptide/active fragment which is extracellular, or expressed on the cell surface. The binding is preferably performed in vivo. APO4 polypeptides/active fragments are also useful for screening for apoints and anteagonists by binding and observing the changer in APO4 activity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/active fragments and APO4 signal transducer molecules that specifically interact with a cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vivo or in vitro. APO polypeptides are also luseful activity activity. The method is performed in vivo or in vitro. APO polypeptides are also luseful for diagnosis/treatment of developmental or gestational
                                                                                                                                                    New Tumor Necrosis Factor family receptor polypeptides and ligands useful for diagnosis and treatment of prostate cancer and developmental or gestational abnormalities
                                                                                                                                                                                                                                                               Claim 34; Fig 11A; 156pp; English.

AAB28553 standard; protein; 285 AA (first entry) 08-FEB-2001 Human TNFL1 **EEXEXEX**

Human; tumour necrosis factor like-1; TNFL1; tumour necrosis factor; TNF; immunosuppressive; antiarthritic; neuroprotective; dermatalogical;

human protein designated tumour necrosis factor like-1 (TNFL1). It may be used to induce cell death in tumours, to induce apoptosis of activated T cells, to induce inflammation, and to rescue resting T cells from apoptosis. TNF receptors are used to regulate the function of a TNF ligand which plays a role in apoptosis, inflammation, differentiation, or proliferation. Expression of the receptors can also be useful as markers for cancer, especially for colon cancer. Diseases which can be treated rheumatoid arthritis, cancer, septic shock, Crohn's disease and osteoporosis. The polynucleotides can be used in gene delivery vehicles, for the purpose of delivering a mRNA or oligonucleotide, full-length protein, fusion protein, polypeptide, or ribozyme, or single-chain antibody, into a cell. The newly identified receptor proteins play regulatory roles in cell proliferation and/or differentiation. The present sequence is given in a specification relating to an isolated gene therapy; effects of TNF-L or TNFR-L subgenomic polynucleotides within the cell receptors can also play a role in the negative regulation of osteoclastogenesis. Soluble TWR-1.1ke receptors can be useful in the neutralisation of TNF or TNF-1.1ke ligands. A TNF-1 protein can also bused to treat autoimmune diseases (myasthenia gravis and Gaps disorders. A TNF-L or TNFR-L subgenomic polynucleotide can also be delivered to subjects for the purpose of screening test compounds fthose which are useful for enhancing transfer of TNF-L subgenomic polynucleotides to the cell or for enhancing subsequent biological colon cancer; rheumatoid arthritis; septic shock; Crohn's disease; osteoporosis; autoimmune disease; myasthenia gravis; insulin-dependent diabetes mellitus. Tumor necrosis factor (TNF) and TNF receptor superfamily protein members TNF-L and TNFR-L, useful for enhancing or decreasing TNF activities such as inducing cell death and lymphoid organogenesis and proliferative 67; Score 1042.5; DB 21; Length 285; cytostatic; osteopathic; Indels ; Pred. No. 1.1e-103;); Mismatches 0; insulin-dependent diabetes mellitus), tumours, antiinflammatory; antidiabetic; Claim 1; Page 65; 77pp; English. ; 93.4%; 05-APR-2000; 2000WO-US09058. 99US-0286529 Best Local Similarity 76.5 Matches 218; Conservative 2000-665004/64.                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human cytokine, designated THANK. THANK is a tumour necrosis factor (TNF) homologue that activates apoptosis, nuclear factor-kB, and c-jun N-terminal kinase. Inhibitors of the THANK polypeptide are used to inhibit the activation of nuclear factor-kB in cells. The method is used to inhibit the activation of nuclear factor-kB in cells, treat pathological conditions such as toxic and septic shock, acute phase response, viral infection, radiation susceptibility, atherosclerosis, cancer, acute inflammatory conditions, arthritis, allery, and graft versus host reaction, and inhibit growth of tumour cells such as myeloid cells, colon cancer cells, prostate cancer cells, cevical carcinoma cells, chronic myeloid leukemic cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9

The present sequence represents a human AGP-3 polypeptide. AGP-3 is a tunour necrosis factor (TNF) ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoslobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immune disorders, and nucleic e.g. rheumatoid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins.

Contact this sequence is not specifically claimed. It is only mentioned in the claims, in that a polypeptide that does not comprise the present expression in that a polypeptide that does not comprise the present in the claims.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     88 GEGNSSQNSRNKRAVQGPEETVTQDCLQLIADSETPTIQKGSYTFVPWLLSFKRGSAL-- 145

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myelloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, pooriasis and lupus erythematosus. The present sequence is human

The TNF-delta polynucleotide is useful in gene therapy for modulating TNF-delta. TNF-delta is useful for treating deficiencies of TNF-delta and diseases ameliorated by TNF-delta. TNF-delta is also useful for screening, diagnosing, prognosing, staging or monitoring conditions or diseases attributable to TNF-delta, e.g. inflammation (e.g. inflammatory bowel disease, sepsis or rheumatoid arthritis). The TNF-delta is also useful as an anti-cancer agent to induce apoptosis in cancer and tumour-associated cells.
                                                                                                                                                                                                                                                                                                                                                                         Human; tumour necrosis factor; TNF-delta; gene therapy; antirheumatic; apoptosis; rheumatoid arthritis; cytostatic; sepsis; anti-inflammatory; inflammatory bowel disease; immunosuppressive; antiarthritic; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New tumor necrosis factors (TNF)-delta polynucleotide and polypeptide, useful in gene therapy, particularly for treating inflammation, and for inducing apoptosis in cancer and tumor-associated cells to treat cancer
